SUMMARY OF WATER CONDITIONS FEBRUARY 1, 1998

This report provides a snapshot of water conditions as they were on February 1. The effect of the storms of the first week of February will be reflected in the next report. After a slow start with less than average precipitation in December, the winter turned wet. A series of El Nino driven storms delivered double normal precipitation in northern California during January building up the snowpack from about 75 percent of average to over 100 percent on February 1. In this 150 year anniversary of the discovery of gold on the American River, the prospects of a good water supply are now excellent.

Forecasts of April through July runoff are near average, slightly over 100 percent statewide. Northern watersheds show the higher percentages. Water year runoff forecasts are higher than the snowmelt forecasts due to ample runoff during January.

Snowpack water content is about 115 percent of average statewide for this date and 75 percent of the April 1 average, the date of maximum accumulation. Last year the pack was 155 percent of average at this time.

Precipitation during January was heavy especially in the northern half of the State, with 170 percent statewide during the month. The seasonal average since October 1 stands at 125 percent compared to 185 percent one year ago.

Runoff so far this season is now above average overall, most of which occurred during the last month. January runoff was estimated to be 190 percent of average and the seasonal amount is 120 percent compared to 290 percent last year. Estimated runoff of the 8 major rivers of the Sacramento and San Joaquin River regions during January was 5.3 million acre-feet.

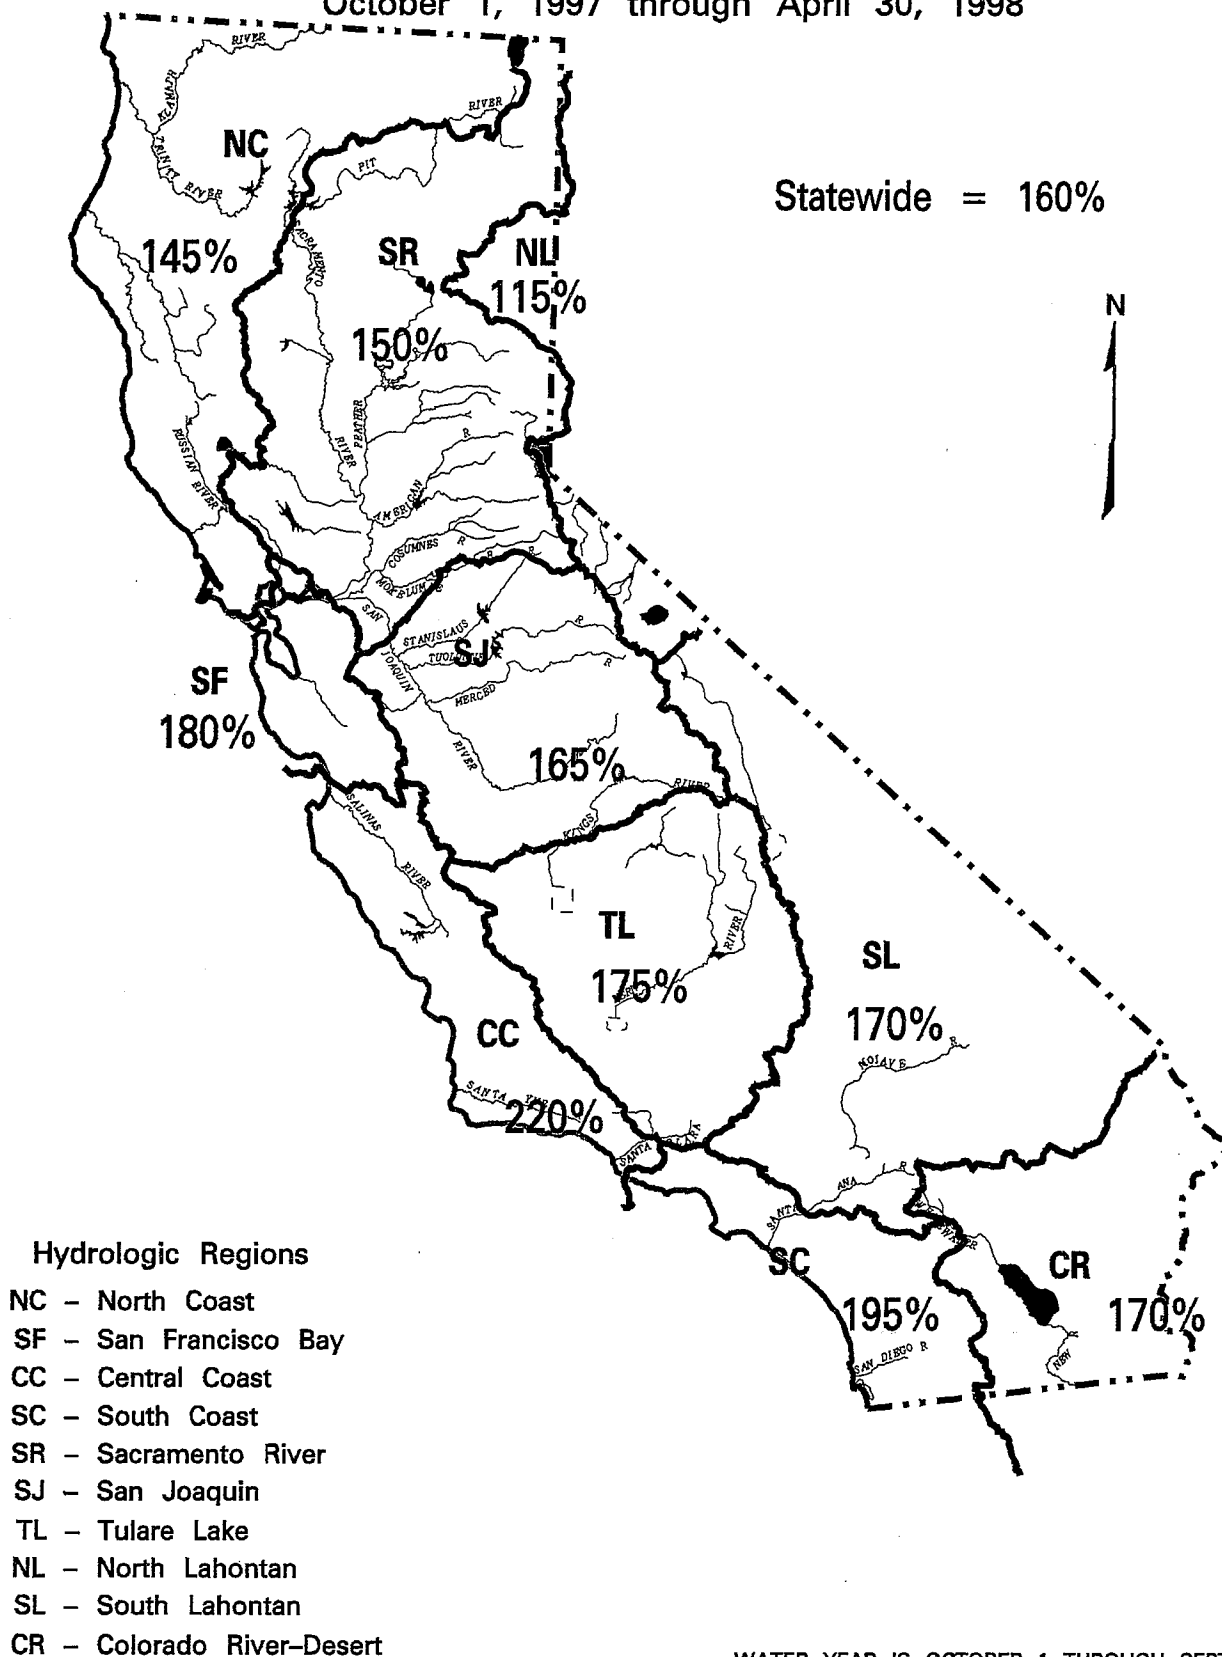

Reservoir storage is now excellent at 115 percent of average overall for this date. Total storage last year stood at 135 percent, but some of that was temporary encroachment into flood control space in Central Valley foothill reservoirs.

SUMMARY OF WATER CONDITIONS IN PERCENT OF AVERAGE

NORTH COAST REGION

Snowpack Accumulation

Water Content in % of April 1 average

SNOWPACK - First of the month measurements made at 10 snow courses indicate an area wide snow water equivalent of 26.9 inches. This is 130 percent of the February 1 average and 90 percent of the seasonal (April 1) average. Last year at this time the pack was holding 16.6 inches of water.

Precipitation

October 1 to date in % of average

PRECIPITATION - Seasonal precipitation (October 1 through the end of last month) on this area was 125 percent of normal. Precipitation last month was about 195 percent of the monthly average. Seasonal precipitation at this time last year stood at 160 percent of normal.

Reservoir Storage

Contents of major reservoirs in % of capacity

RESERVOIR STORAGE - First of the month storage in 7 reservoirs was 2.3 million acre-feet which is 105 percent of average. About 75 percent of available capacity was being used. Storage in these reservoirs at this time last year was 120 percent of average.

Runoff

October 1 to date in % of average

RUNOFF - Seasonal runoff of streams draining the area totaled 6.9 million acre-feet which is 125 percent of average for this period. Last year, runoff for the same period was 240 percent of average.

SACRAMENTO RIVER REGION

Snowpack Accumulation

Water Content in % of April 1 average

SNOWPACK - First of the month measurements made at 36 snow courses indicate an area wide snow water equivalent of 39.9 inches. This is 130 percent of the April 1 average and 170 percent of average for this date. Last year at this time the pack was holding 10.2 inches of water.

Precipitation

October 1 to date in % of average

PRECIPITATION - Seasonal precipitation (October 1 through the end of last month) on this area was 150 percent of normal. Precipitation last month was about 135 percent of the monthly average. Seasonal precipitation at this time last year stood at 120 percent of normal.

Reservoir Storage

Contents of major reservoirs in % of capacity

RESERVOIR STORAGE - First of the month storage in 43 reservoirs was 13.8 million acre-feet which is 105 percent of average. About 85 percent of available capacity was being used. Storage in these reservoirs at this time last year was 105 percent of average.

Runoff

October 1 to date in % of average

RUNOFF - Seasonal runoff of streams draining the area totaled 21.3 million acre-feet which is 160 percent of average for this period. Last year, runoff for the same period was 165 percent of average.

The Sacramento River Region **40-30-30 Water Supply Index** is forecast to be 12.4 million acre feet assuming median meteorological conditions for the remainder of the year. This classifies the year as "wet" in the Sacramento Valley according to the State Water Resources Control Board.

SAN JOAQUIN RIVER and TULARE LAKE REGIONS

Snowpack Accumulation Water Content in % of April 1 average

Precipitation

October 1 to date in % of average

Reservoir Storage

Contents of major reservoirs in % of capacity

Runoff

October 1 to date in % of average

■ WY 1997 ■ WY 1998

SNOWPACK - First of the month measurements made at 58 San Joaquin Region snow courses indicate an area wide snow water equivalent of 50.4 inches. This is 160 percent of the April 1 average and 200 percent of average for this month. Last year at this time the pack was holding 21.5 inches of water. At the same time, 45 Tulare Lake Region snow courses indicated a basin-wide snow water equivalent of 40.9 inches which is 180 percent of the April 1 average and 225 percent of average for this month. Last year at this time the basin was holding 18.0 inches of water.

PRECIPITATION - Seasonal precipitation (October 1 through the end of last month) on the San Joaquin River Region was 165 percent of normal. Precipitation last month was about 145 percent of the monthly average. Seasonal precipitation at this time last year stood at 135 percent of normal.

Seasonal precipitation on the Tulare Lake Region was 175 percent of normal. Precipitation last month was 165 percent of the monthly average. Seasonal precipitation at this time last year stood at 140 percent of normal.

RESERVOIR STORAGE - First of the month storage in 33 San Joaquin River Region reservoirs was 8.6 million acre-feet which is 115 percent of average and about 75 percent of available capacity. Storage in these reservoirs at this time last year was 120 percent of average. First of the month storage in 6 Tulare Lake Region reservoirs was 1.4 million acre-feet which is 145 percent of average and about 65 percent of available capacity. Storage in these reservoirs at this time last year was 150 percent of average.

RUNOFF - Seasonal runoff of streams draining the San Joaquin River Region totaled 5.1 million acre-feet which is 150 percent of average for this period. Last year, runoff for the same period was 245 percent of average. Stream runoff draining into the Tulare Lake Region totaled 1.9 million acre-feet which is 155 percent of average for this period. Last year, runoff for the same period was 250 percent of average. The San Joaquin River Region 60-20-20 Water Supply Index is forecasted to be 5.1 million acre-feet assuming median meteorological conditions for the remainder of the year. This classifies the year as "wet" in the San Joaquin Valley according to the State Water Resources Control Board.

NORTH and SOUTH LAHONTAN REGIONS

Snowpack Accumulation

Water Content in % of April 1 average

Precipitation

October 1 to date in % of average

Reservoir Storage

Contents of major reservoirs in % of capacity

Runoff

October 1 to date in % of average

■ WY 1997 ■ WY 1998

SNOWPACK - First of the month measurements made at 13 North Lahontan snow courses indicate an area wide snow water equivalent of 17.1 inches. This is 90 percent of the February 1 average and 60 percent of the seasonal (April 1) average. Last year at this time the pack was holding 33.4 inches of water.

At the same time, 16 South Lahontan snow courses indicated a basin-wide snow water equivalent of 10.7 inches, which is 95 percent of the average for February 1 and 60 percent of the seasonal average. Last year at this time the pack was holding 32.7 inches of water.

PRECIPITATION - Seasonal precipitation (October 1 through the end of last month) on the North Lahontan Region was 90 percent of normal. Precipitation last month was about 130 percent of the monthly average. Seasonal precipitation at this time last year stood at 250 percent of normal.

Seasonal precipitation on the South Lahontan Region was 75 percent of normal. Precipitation last month was 60 percent of the monthly average. Seasonal precipitation at this time last year stood at 120 percent of normal.

RESERVOIR STORAGE - First of the month storage in 5 North Lahontan Region reservoirs was 780 thousand acre-feet which is 140 percent of average. About 75 percent of available capacity was being used. Storage in these reservoirs at this time last year was 185 percent of average. Lake Tahoe was 4.3 feet above its natural rim on February 1.

First of the month storage in 8 South Lahontan Region reservoirs was 270 thousand acre-feet which is 95 percent of average. About 65 percent of available capacity was being used. Storage in these reservoirs at this time last year was 85 percent of average.

RUNOFF - Seasonal runoff of streams draining the North Lahontan area totaled 113 thousand acre-feet which is 75 percent of average for this period. Last year, runoff for the same period was 400 percent of average.

Seasonal runoff of the Owens River in the South Lahontan Region totaled 47 thousand acre-feet which is 105 percent of average for this period. Last year, runoff for this same period was 135 percent of average.

SAN FRANCISCO BAY and CENTRAL COAST REGIONS

Precipitation

October 1 to date in % of average

PRECIPITATION - Seasonal precipitation (October 1 through the end of last month) on the San Francisco Bay area was 180 percent of normal. Precipitation last month was about 135 percent of the monthly average. Seasonal precipitation at this time last year stood at 130 percent of normal.

Seasonal precipitation on the Central Coast area was 220 percent of normal. Precipitation last month was about 160 percent of the monthly average. Seasonal precipitation at this time last year stood at 115 percent of normal.

Reservoir Storage

Contents of major reservoirs in % of capacity

RESERVOIR STORAGE - First of the month storage in 18 major Bay area reservoirs was 644 thousand acre-feet which is 125 percent of average. About 90 percent of available capacity was being used. Storage in these reservoirs at this time last year was 115 percent of average.

First of the month storage in 6 major Central Coast reservoirs was 923 thousand acre-feet which is 135 percent of average. About 100 percent of available capacity was being used. Storage in these reservoirs at this time last year was 110 percent of average.

Runoff

October 1 to date in % of average

RUNOFF - Seasonal runoff of the Napa River in the San Francisco Bay area totaled 137 thousand acre-feet which is 200 percent of average for this period. Last year, runoff for the same period was 170 percent of average.

Seasonal runoff of selected Central Coast streams totaled 733 thousand acre-feet which is 230 percent of average for this period. Last year, runoff for the same period was 170 percent of average.

SOUTH COAST

PRECIPITATION - October through January (seasonal) precipitation on the South Coast area was 115 percent of normal. January precipitation was 95 percent of the monthly average. Seasonal precipitation at this time last year was 160 percent of normal.

Seasonal precipitation on the Colorado Desert area was 65 percent of normal. Precipitation in January was 80 percent of average. Seasonal precipitation at this time last year stood at 80 percent of average.

RESERVOIR STORAGE - February 1 storage in 29 major South Coast area reservoirs was 1.4 million acre-feet or 115 percent of average. About 70 percent of available capacity was being used. Storage in these reservoirs at this time last year was 130 percent of average.

On February 1 combined storage in Lakes Powell, Mead, Mohave and Havasu was about 48 million acre-feet or 125 percent of average. About 90 percent of available capacity was in use. Last year at this time, these reservoirs were storing 115 percent of average.

RUNOFF - Seasonal runoff from selected South Coast streams totaled 11 thousand acre-feet which is 60 percent of average. Runoff from these streams during January totaled 5 thousand acre-feet or 55 percent of average. Seasonal runoff from these streams last year was 150 percent of average.

COLORADO RIVER

The May 1 snowpack in the Upper Colorado River basin according to U.S. Natural Resources Conservation Service reports was 85 percent of average, highest in the Upper Colorado and Dushesne at 90 percent and lowest in the Animas at 62 percent.

The April through July inflow to Lake Powell is forecast to be 6.9 million acre-feet, which is 89 percent of average.

CENTRAL VALLEY PROJECT

Based on February 1 conditions, Bureau of Reclamation water year forecasts for unimpaired runoff to CVP reservoirs are: Trinity--136% of average, Shasta--156% of average, American--127% of average, Stanislaus--114% of average, San Joaquin above Friant--107% of average. As of January 31, 1998 CVP storage was 8.4 million acre feet which is a decrease of 0.7 million acre feet compared to one year ago, and is approximately 123% of normal for that date.

The Bureau of Reclamation announced preliminary water allocations for the CVP contractors on January 16, 1998. Based on conservative water supply forecasts prepared from information available January 1, 1998 CVP water allocations were: Agricultural contractors-50%; Urban contractors-100%; Sacramento River water rights and San Joaquin Exchange Contractors- 100%; Wildlife Refuges-100%. Updated allocations will be announced February 13, 1998.

STATE WATER PROJECT

State Water Project deliveries have been approved at about 2.4 million acre feet which meets at least 60 percent of most contractors' entitlement. This approval considered several factors, including the existing storage in SWP reservoirs, a conservative projection of hydrology and water supply expected to develop during the remainder of the 1998-99 water year, SWP operational constraints, and 1998 contractor demands. Approvals will be reevaluated with each new round of water supply forecasts.

February 1 Statewide Conditions

SNOWLINES

BULLETIN 120 is now available on the web. Please check <http://snow.water.ca.gov> for a preview of our efforts.

TESTS of the new snow water content detector continue at the Snow Lab located in Soda Springs. This detector, developed by Sandia National Labs, measures cosmic radiation. A detector above the snow and one at ground level measures the attenuation of that radiation by the snow. From this measurement the water content can be computed. A paper will be presented at the 1998 meeting of the Western Snow Conference describing the results of these tests.

THE 1998 WESTERN SNOW CONFERENCE annual meeting will be held April 20-23 at Snowbird, Utah. Contact Frank Gehrke at 916-547-2635 or gridley@water.ca.gov for more information.

SNOWPACK - Snow data is a major index of spring and summer runoff from Sierra Nevada watersheds. April 1 data historically reflects the magnitude of the snowpack at or near the maximum seasonal accumulation. Averages are based on April 1 data for the period 1946-1995 (50 years, except for data sites established after 1946).

PRECIPITATION - Averages are based on April 1 data for the period 1946-1995 (50 years, except for data sites established after 1946).

RUNOFF AND FORECASTS - Runoff data and runoff forecasts are shown as unimpaired values. Unimpaired runoff represents the natural water production of a river basin, unaltered by upstream diversions, storage, or by export or import of water to or from other watersheds. Forecast of runoff assumes median conditions subsequent to the date of forecast.

Runoff probability ranges are statistically derived from historical data. The 80 percent probability range is comprised of the 90 percent exceedence level value and the 10 percent exceedence level value. This means that actual runoff should fall within the stated limits eight times out of ten.

Runoff averages for most streams are based on the period 1946-1995. For more details contact California Cooperative Snow Surveys, P.O. Box 942836, Sacramento, CA 94236-0001, (916) 574-2635 or gridley@water.ca.gov.

INDICES OF WATER AVAILABILITY

The Sacramento River Hydrologic Region 40-30-30 Water Supply Index. The 40-30-30 represent the percentage weight given to the three variables in the formula for the index. The first variable is the forecasted unimpaired runoff from April through July (*40 Percent*). The second variable is the forecasted unimpaired runoff from October through March (*30 Percent*). The third variable is the previous year's index with a cap to account for required flood control releases during wet years. The basins used in this computation are those used in the Sacramento River water year unimpaired runoff.

The Sacramento River water year unimpaired runoff is the sum of: Sacramento River above Bend Bridge, Feather River Inflow to Lake Oroville, Yuba River near Smartville and American River Inflow to Folsom Lake.

The San Joaquin River Hydrologic Region 60-20-20 Water Supply Index. In a similar manner, the 60-20-20 represents the percentage weights on April through July runoff, October through March runoff and previous year's index. The San Joaquin River unimpaired runoff is the sum of: Stanislaus River Inflow to New Melones Lake, Tuolumne River Inflow to New Don Pedro Reservoir, Merced River Inflow to Lake McClure and San Joaquin River Inflow to Millerton Lake.

Prior month unimpaired runoff is the sum of the runoff in the eight major rivers used in the two above indices.
